Ranking Distillation: Learning Compact Ranking Models With High Performance for Recommender System Jiaxi Tang, Ke Wang School of Computing Science, Simon Fraser University **Training Paradigm of Ranking Distillation Experimental Setup** Inspired by KD, we use a well-trained teacher model to provide more • *Task*: Sequential Recommendation training instances to make a student model perform better. For a certain query (user profile), we use the top-K ranked documents • Datasets: Gowalla & Foursquare (items) as the extra positive training instances. • Base Model: Fossil & Caser Ground-truth • Baselines: Student Model: M_S Document Labels: y • *Model-T: Teacher model* Given Query q • *Model-S: Student model* Compute Ranking Labeled • Model-RD: Student model trained with ranking distillation Loss: \mathcal{L}^{R} Document Set O **Evaluation Metrics:** Compute Distillation Teacher Model: M_T Precision@n $(n \in \{3, 5, 10\})$ Loss: \mathcal{L}^{D} 1) (well-trained) Unlabeled 2) nDCG@n ($n \in \{35, 10\}$) Document Model Predicted Top-K 3) Mean Average Precision (MAP) Set $\overline{\mathcal{O}}$ Ranking: $\pi_{1..K} = (\pi_1, \pi_2 ... \pi_K)$ **Forward Propagation** Traditional Module **Backward Propagation Distillation Module Experimental Results** • Evaluation on model efficiency: Weighted Point-wise Distillation Loss Generating a recommendation list for every user. Models with less parameters has less inference time cost. The distillation loss L^D is formulated as a weighted point-Label Distribution wise loss: Learns to $\mathcal{L}^{D}(\boldsymbol{\pi}_{1..K}, \hat{\boldsymbol{y}}) = -\sum_{r=1}^{N} w_{r} \cdot \log(P(rel = 1|\hat{y}_{\pi_{r}}))$ $\pi_{1..k}$: teacher's top-K minimize ranked items KL-Label Distribution divergence \hat{y} : student's prediction $= -\sum_{r=1}^{\infty} w_r \cdot \log(\sigma(\hat{y}_{\pi_r})),$ $\sigma(\cdot)$: sigmoid function Weighting by position importance w^a

Abstract

- We try to make effective but expensive model to be compact while still perform well.
- We propose a training paradigm called *ranking distillation* for learning compact ranking models with high performances.
- We use our method on **Recommender System**, a typical ranking problem.
- Experiments on real world datasets demonstrate the effectiveness of our proposed method.

Knowledge Distillation

- For image classification, KD first train a teacher model from dataset with many parameters to achieve high performance.
- Then KD train a small student model from the same dataset and the teacher model.
- Eg. For a cat image, a well-trained teacher model also supervise the student model to predict **tiger**.

Effectiveness vs. Efficiency

- For a specific ranking model, there are typically two ways to make it perform better:
 - 1. By having more parameters until the model get overfitted. (more flexibility and expressiveness)
 - 2. By using more data to train the model. (more generalizable and robust for future data)

Exponentially decayed function, with hyperparameter λ to control the decay speed.

Assumption: Top ranked items from teacher's prediction are more *correlated* to the query and the ground-truth positive item

$$w_r^a \propto e^{-r/\lambda}$$
 and $\lambda \in$

Weighting by ranking discrepancy w^{D} Non-negtive function to measure how well a student learned from its teacher, with hyperparameter μ to control the pen. Assumption: During the training process, we should have a dynamic weight to upweight the erroneous parts in distillation loss, and downweight the parts that already learned perfectly.

 $w^{\beta} = \tanh(\mu(\text{student's rank} - \text{teacher's rank}))$

| | Teacher's rank | Student's rank | |
|---------|----------------|----------------|-------------------|
| π_1 | 1 | 1 | \mathcal{L}^{I} |
| π_2 | 2 | 5 | |
| π_3 | 3 | 156 | |

 $\in \mathbb{R}^+$

 $w_1^b * \log(\hat{y}_{\pi_1})$ $w_2^b * \log(\hat{y}_{\pi_2})$ $- \rightarrow w_3^b >> w_2^b > w_1^b$ $w_3^b * \log(\hat{y}_{\pi_3})$

| Datasets | Model | Time (CPU) | Time (GPU) | #Params | Ratio |
|------------|-----------|---------------|---------------|---------|-------|
| | Fossil-T | 9.32s | 3.72s | 1.48M | 100% |
| Corrollo | Fossil-RD | 4.99s | 2.11s | 0.64M | 43.2% |
| Gowalia | Caser-T | 38.58s | 4.52s | 5.58M | 100% |
| | Caser-RD | 18.63s | 2.99s | 2.79M | 50.0% |
| | Fossil-T | 6.35s | 2.47s | 1.01M | 100% |
| Foursquare | Fossil-RD | 3.86s | 2.01s | 0.54M | 53.5% |
| rouisquare | Caser-T | 23.89s | 2.95s | 4.06M | 100% |
| | Caser-RD | 11.65s | 1.96s | 1.64M | 40.4% |

• Evaluation on model effectiveness Models with ranking distillation, Fossil-RD and Caser-RD, always has statistically *significant improvements* over the student-only models, Fossil-S and Caser-S

The performance of the models with ranking distillation, Fossil-RD and Caser-RD, *has no significant degradation* from that of the teacher models
